Efficient, ergonomic and robust: the scaleable picking solution

Efficient order picking with oneGRID system

oneGRID System is a pick-by-light solution for medium-sized manufacturing companies covering all relevant functions of a distributed WMS. The modular and open system links hardware with software solutions. It can be easily integrated into your existing software architecture and easily expanded – for easy digitization of your material flows in production and intralogistics.

oneGRID system offers you decisive advantages

Increased speed and throughput as well as minimization of errors through process-optimized work

Intuitive, fatigue-free working thanks to touch operation

Simple and fast integration into existing – even non-digital – processes

Versatile use due to numerous combinations and configurations

> I use oneGRID System because I want to avoid system breaks. In addition, we cannot afford any other expensive software and only want to maintain our master data in one place. Our production processes are sacred to us - they must always work and at the same time be dynamic. We can fully rely on CAPTRON Solutions.

Anne, Head of Intralogistics
